BABYLISS PRO ECO DRYER BAB6170E - hair dryer with ECO technology

dryer that combines the control of energy and drying performance. The performance of a dryer are the result of the combination of different characteristics: temperature (power), airflow, air speed, air pressure.

The ECO DRYER thanks to its technology and its ECO -design, offers the perfect balance between the various characteristics of a flow of air, so as to ally the comfort of use, the drying power and energy efficiency.

A device that also has the distinction of operating as effectively on 2 different modes:

- A NORMAL mode to a power of 1800 W ;
- ECO mode to a power of 1200 W

The ECO mode has a real power of 1200 W and is able to produce an air speed of 100 km / h. From this derives the energy efficiency, which is the result of the relationship between energy consumed and energy returned to a lower energy loss and better performance.

The ECO DRYER is equipped with the latest generation of DC motor, lightweight : only a hundred grams. The permanent magnet is composed of alloys of materials rare earths.

These materials rare earths possess a higher density of magnetic energy, producing a magnetic field substantially greater than that produced by the permanent magnets of ferrite compounds that are found in classic DC motors. Therefore, the torque of the engine, ie the mechanical power that drives the rotation of the turbine, is more powerful. Result: air velocity, air volume and air pressure higher, energy saving.

Features:

- Extremely quiet and lightweight (412 g);
- Excellent ergonomics and excellent balance, in order to minimize muscle tension.
